Target Audience

The target audience is technical team(s) that handle the processing of the transaction report files. They should have reasonable knowledge of XML/XSD and of the Cards industry.

What's Changed?

If you want to find out what's changed since the previous release, see the [Document History](#) section.

How to Use this Guide

SECTION 1: GETTING STARTED

You should read this section if you are new to Thredd reports in Global Transaction Reporting. This will enable you to understand the types of reports that are available and how they are provided.

Topics covered in this section:

- [Introduction](#)
- [Transactional Data Files](#)
- [Reports Data Schema](#)

Tip: To find out what has changed, see the [Document History](#).

1.1 Introduction

Thredd's Global Transaction Reporting provides transaction reports that you can receive at the local time you require, regardless of your organisation's timezone. This ensures that the sending of the reports are not fixed to a specific UTC time as set by Thredd. The reports contain details of transactions processed on the system during the past 24 hours, including authorisations and financial transactions for the Visa and Mastercard card schemes, as well as MNE (Mastercard Networks Exchange).

Transaction reports use Thredd's XML reporting system for Global Transaction Reporting, which employs the Secure File Transfer Protocol (sFTP). In the reporting system, Thredd processes incoming requests from the Card Schemes (payment networks) using its real-time authorisation engine.

Figure 1: Global Transaction Reporting

1.1.1 Non-Clearing and Clearing Reports

Thredd's Global Transaction Reporting provides Non-clearing and Clearing reports for cardholder transactions.

The Non-Clearing Report includes data relating to authorisations, loads/unloads, balance adjustments (via webservice). The report also consists of cardholder fees generated by Thredd (you have set up in your fee groups) and other Thredd data.

The Clearing Report provides details on financials, interchange fees and chargebacks.

You can use these reports to reconcile against Mastercard or Visa settlement advices. You can also use the reports to reconcile with data received from EHI. The format and content of the transaction clearing and non-clearing data reports are described in this guide.

1.1.2 Other Types of Reports

In addition to Non-Clearing and Clearing reports, Thredd generates the:

- Balance Report
- Fee Collection Report
- Quarterly Scheme Report

Balance Report

The Balance Report is relevant where Thredd maintains details of card balances, such as in EHI modes 2,3,4 and 5 or where EHI is not being used. This report provides details of the balance on each card at the time of your chosen cut-off and generation. You can use this report to confirm how much money is on the card according to Thredd systems (where Thredd maintain the balance). You can compare this to information you hold in your local card database. Like the transaction reports, you can receive reports at the local time you require regardless of your organisation's time-zone.

Fee Collection Report

The Fee Collection Report is a daily summary of Scheme (Mastercard/Visa/MNE) fees by ICA and currency for reconciling against the Mastercard/Visa/MNE Settlement summary reports. The report is provided to issuers and self-issuers. It includes transaction categories such as Interregional non-financial ATM transaction fees, and fees for ATM PIN management and ATM Balance Inquiry fees. For more information, contact your Thredd Implementation Manager or Account Manager.

Quarterly Scheme Report

The Quarterly Scheme Report contains quarterly data needed to fill in/submit the quarterly scheme reports:

- **Mastercard** – Quarterly Management Reports
- **VISA** – Global Operation Certificates

The report include details such as the number of live cards, cards issued, and information on card activity and status. This report is provided to issuers and self-issuers. For more information, contact your Thredd Implementation Manager or Account Manager.

1.2 Transactional Data Files

For Global Transaction Reporting, Thredd can supply you with daily transaction-related data reports in the XML file format at the time settings you require. The files are delivered to you via sFTP.

Note: Bear in mind that if you need to keep transaction records over time, you must follow the right business processes for maintaining the records.

1.2.1 XML File Contents

File contents include either the Clearing Report or the Non-Clearing Report.

Clearing Report

The Clearing Report contains all the available presentments on the Thredd platform, which have been received and processed at the InitiationTime. This is data that is used for clearing. For an example of a Clearing Report, see [Clearing Transaction Report Example](#).

Non-Clearing Report

The Non-Clearing Report contains authorisation, load, unload and fee data on the Thredd platform. This data is received and processed at the InitiationTime. For an example of a Non-Clearing Report, see [Non-Clearing Transaction Report Example](#).

1.2.2 File Sending Schedule

Thredd can send files of generated reports at a time that meets your business requirements. For each report type, you can choose the InitiationTime, ToTime and FromTime settings. The following table summarises the time settings:

Time	Description
InitiationTime	The time of day you select for Thredd to start the generation of an individual report.
ToTime	The latest time threshold/end interval during the day for the timestamp transactions to be included in the report. InitiationTime is always >= to the ToTime.
FromTime	The earliest time threshold/start interval during the day for timestamp transactions to be included in the report. By default, FromTime = ToTime over a 24h period.
GenerationTime	The time needed to produce a report, spanning between InitiationTime and the time when the XML file for the report has been created.
TransportationTime	Disk and network time needed to copy a readily available XML file/report to the client sFTP folder.
DeliveryTime	The time when the XML file/report is available in the client's sFTP folder for pick-up.

GenerationTimes and TransportationTimes determine the DeliveryTime of the report. The DeliveryTime depends on the number or volume of transactions in the file that passed from the report InitiationTime.

By default, Thredd use the following logic for the reports:

- **Non-Clearing Report** – By default, the InitiationTime is after midnight in your selected timezone. The FromTime is 00:00 of the previous day (D-1) in relation to the InitiationTime. The ToTime is 23:59 of the previous day (D-1) in relation to the report InitiationTime.
- **Clearing Report** – The Initiation, From and ToTimes are selectable (FromTime = ToTime over a 24h period).

Card Scheme and Gateway Provider Considerations

If you want your Clearing Reports to include Visa and Mastercard transactions, you need to consider the clearing cycles for these card schemes. The clearing cycles can influence the XML file sending schedule from Thredd for the Clearing Reports. For MNE¹ gateway transactions, the clearing cycles **do not** apply. This is because MNE sends transactions that are SMS messages, where authorisation and clearing data are in the same message. When Thredd sends to you MNE transactions data, these are included within **Non-Clearing Reports**.

The clearing cycles are summarised as follows:

- **Mastercard** – There are 6 clearing cycles per day, seven days per week. After each clearing cycle, Mastercard sends Thredd clearing files, which contain the settlement data. Data from cycles 5-6 from the night before and 1-4 from current day form a complete settlement day picture for most regions. These contain all the information you need to reconcile your settlements with Mastercard.
- **Visa** – Visa provide 2 clearing files (Domestic and International) each day. For International visa cycles, different timings exist for some regions (For example, Australia and Hong Kong). There is a maximum file size where, for the largest clients, it is possible that more than one Domestic and/or International file will be received on the same day. Visa domestic cycles start at 9 am, while international cycles start at mid-day. The clearing cycles occur for 7 days a week.

1.2.3 File Naming Convention

The transaction report files that you receive from Thredd use the following naming convention:

Type of Report	Environment	Naming Convention
Non-Clearing Report	PX	THRD-PPPP-NCLR-YYYYMMDDHHMM-YYYYMMDDHHMM.PX.xml
Clearing Report	PX	THRD-PPPP-CLR-YYYYMMDDHHMM-YYYYMMDDHHMM.PX.xml

Where:

- **THRD** – Abbreviation for Thredd.
- **PPPP** – Programme manager code or name.
- **NCLR** – Report code. NCLR is for a Non-Clearing file and CLR is for a clearing file.
- **YYYYMMDDHHMM** – FromTime, first occurrence after report code. This includes YYYY for year (4 digits), MM for month (2 digits) and DD for day (2 digits).
- **YYYYMMDDHHMM** – ToTime, second occurrence after report code). This includes YYYY for year (4 digits), MM for month (2 digits) and DD for day (2 digits).
- **PX** - Thredd production environment used to generate the report, value of X indicating the exact environment.

Non-Clearing and Clearing Report Examples

The following shows examples of files for a Non-Clearing Report and Clearing Report.

Example	Type of Report	Description
THRD-ABC-NCLR-202401250000-202401260000.P1.xml	Non-Clearing Report	This file includes a snapshot of all non-clearing transactions recorded for the ABC program manager, available on the Thredd platform. The file includes the respective statuses at the report InitiationTime with a timestamp between the 25th of January 2024, 00:00 and the 26th of January 2024, 00:00 on Thredd's Production 1 environment.
THRD-ABCD-CLR-202402151400-202402161400.P2.xml	Clearing Report	This file includes a snapshot of all clearing transactions recorded for the ABC program manager, available on the Thredd platform. This file includes the respective statuses at the report InitiationTime with a timestamp between the 15th of February 2024, 14:00 and the 16th of February 2024, 14:00 on Thredd's Production 2 environment.

¹MNE (Mastercard Networks Exchange) This is a [Sub_Elements_and_Attributes.htm](#)US PIN debit network provider for opening access to US debit networks.

Note: For details on which production environment applies to your programme, check with your Thredd implementation manager or account manager.

1.2.4 Encryption and Encoding

XML files are encrypted using PGP, which requires the sharing of keys. For details, contact your implementation manager.

All of the XML data files are well-formed XML (UTF-8 encoded).

Note: As XML is case-sensitive, you should ensure that you follow the correct casing for all XML elements and attribute names when processing the message.

1.3 Transaction Matching

All transactions reported to Thredd via the card schemes (Visa, Mastercard and MNE) are included in the Clearing Report and the Non-Clearing Report, as well as the EHI data feed. You can use the information in these reports to match and reconcile against data received via EHI, check for any duplicate records, and match authorisation records. When matching authorisation records, you can match advices and reversals to financial records (for example, presentments and chargebacks.)

1.3.1 Matching Authorisations to Financial Records

You can use the following fields to match records in each of the reports:

Field Type	Non-Clearing report: CardAuthorisation Record	Clearing report: CardFinancial Record
Unique identifier of an authorisation transaction	AuthId	AuthId
Approval code generated by the issuer and printed on the receipt	ApprCode	ApprCode
Unique identifier of a financial record	-	FinId
Unique identifier of a presentment record	-	PresentmentId
Information for uniquely identifying a transaction	Trace	-

1.3.2 Matching Transaction Records to EHI Records

You can use the following fields to match transaction records in the reports to EHI records:

Field Type	Transaction Report Record	EHI Record
Unique identifier of the card linked to the transaction (available in both the Clearing Report and the Non-Clearing Report)	PAN	Token
Unique identifier of an authorisation transaction (available in both the Clearing and Non-Clearing Report)	AuthId	TXn_ID
Unique identifier of a financial record (available in the Clearing Report)	FinId	TXn_ID

For details of EHI fields, refer to the *External Host Interface (EHI) Guide*.

1.4 Reports Data Schema

The data schemas for the Non-Clearing Report and Clearing Report in Global Transaction Reporting describe their structure and possible data values within those reports.

You can validate each transaction XML file you receive from Thredd against the provided Schema (XSD file). This ensures that the transaction file is in the correct format.

The data schemas for the Non-Clearing Report and Clearing Report are subject to change as the standard evolves. When Thredd updates either XSD report file, Thredd implements a new version and notifies you.

1.4.1 Schema Versions

Schema files are versioned according to changes in the schemas. The schema filename indicates the schema version number. There is a comments section in each schema file that provides details of the version changes. Thredd sends schema files when a new version of the XML is published.

For an example of the current data schema, see the [Non-Clearing Report XML Data Schema](#) and [Clearing Report XML Data Schema](#).

1.4.2 Schema Elements

An XML file conforming to the schema consists of the following elements:

- [Primary elements](#)
- [Sub-elements and attributes](#)

SECTION 2: PRIMARY ELEMENTS

This section describes the Primary Elements within the transaction reports for Global Transaction Reporting.
Topics covered in this section:

- Primary Elements

Non-Clearing Report

2.1 Primary Elements

Primary Elements are listed within a `<Transactions>` parent element, which defines the top-level entities of the message. See the table below for details.

Note: Primary elements within an XML message depends on the card activity for the period being reported. For example, `<CardChrgBackRepRes>` elements are only present when a chargeback (or reversal) or Representation (or reversal) is reported.

2.12 CardChrgBackRepRes

CardChrgBackRepRes describes the following record types:

- **Chargeback Advice** – created when the issuer raises a chargeback notification to reclaim funds from a merchant after a disputed purchase. For example, the issuer raises a notification where the cardholder claimed that the transaction was fraudulent or that they did not receive the product that was purchased. The funds that were previously debited from the card for the disputed transaction are now returned to the card.
- **Chargeback Reversal** – created when the issuer reverses a previous chargeback notification (withdraws the chargeback).
- **Representment Advice** – created when a merchant disputes a chargeback by providing evidence that the reason for the chargeback claim was invalid.
- **Representment Reversal** – created by the acquirer when they want to withdraw the representment. For example, if the merchant provided insufficient or invalid evidence or missed the representment deadline.

Section 5: FAQs

General FAQs

This section provides answers to frequently asked questions.

Types of Reports

What type of reports does Thredd provide?

Thredd provides the following reports to Program Managers:

- Clearing Report (transaction data)
- Non-Clearing Report (transaction data)
- UTC Balance reports

Note:

For Issuers and Self-Issuers, Thredd provides two additional reports:

- Fee Collection Report
- Quarterly Management Report (QMR)

For details, please contact your implementation manager or account manager.

When does Thredd send the reports?

As part of the Global Transaction Reporting capability, Thredd can send the reports at the local time you require.

Can I configure the details provided in each report?

No, you cannot configure the Thredd reports. If you require bespoke reports, please speak to your Account Manager.

Delivery of Reports

How often are reports provided? Can I change this?

Thredd provides the Non-Clearing Report once a day. You can configure the sending of the Clearing Report, where Thredd can send a report up to 6 times a day, following each clearing file Thredd receives from the card schemes.

How are reports provided to customers?

Thredd provide daily reports to customers via sFTP. This is on a push only basis.

How often do you change the fields in the report?

Thredd adds new fields to the report in line with updates from the card schemes (Visa and Mastercard), or to reflect other changes relevant to the payments industry or Thredd's service.

When making changes to the reports, Thredd updates the technical documentation and notifies you of the change.

What report file formats are available?

Thredd currently supports XML and Comma Separated Variable (CSV) formats.

Are reports encrypted?

Yes. Thredd encrypts reports using the PGP standard.

How do I identify the version of the report?

The XML schema version is listed in the comments section of the schema, together with details of what has changed.

How large is a typical report?

The size is based on the number of your transactions and can be anything from 1KB to 2GB. Thredd splits up anything larger than 2GB into smaller files, for example,, *filename.001*, *filenename.002* and *filename.003*.

Do you store reports and if so, for how long?

Thredd stores reports for up to 2 calendar days on the sFTP server, after which they are deleted from the server. Thredd archives the historical files for a limited period. For access to historical files, please raise a JIRA request.

Using the Reports

How can I use the reports?

You can use reports to do the following:

- Update your transactions database.
- Manage the transaction reconciliation.

Glossary

This page provides a list of glossary terms used in this guide.

A

Account Verification

A type of authorisation transaction which is intended to confirm that the account is genuine and active. Account Verifications are always for a zero amount, so only appear in Authorisation messages and never in clearing messages.

Acquirer

The merchant acquirer or bank that offers the merchant a trading account, to enable the merchant to take payments in store or online from cardholders.

Authentication

This includes checks to confirm the cardholder identity, such as PIN, CVV2 and CAVV.

Authorisation

Stage where a merchant requests approval for a card payment by sending a request to the card issuer to check that the card is valid, and that the requested authorisation amount is available on the card. At this stage the funds are not deducted from the card.

C

Card Scheme

Card network, such as MasterCard or Visa, responsible for managing transactions over the network and for arbitration of any disputes.

Chargeback

Where a cardholder disputes a transaction on their account and is unable to resolve directly with the merchant, they can raise a chargeback with their card issuer. The chargeback must be for a legitimate reason, such as goods and services not received, faulty goods, or a fraudulent transaction.

Clearing File/Clearing Transaction

Thredd receive batch clearing files from the card networks, containing clearing transactions, such as presentments and network fees. The card issuer transfers the requested settlement amount to the acquirer and 'clears' the amount on the card, reducing the available card balance accordingly.

E

External Host Interface (EHI)

The External Host Interface provides a facility to enable exchange of data between Thredd and external systems via our web services. All transaction data processed by Thredd is transferred to the External Host side via EHI in real time. For certain types of transactions, such as Authorisations, the External Host can participate in payment transaction authorisation.

I

ICA

The Interbank Card Association Number (ICA) is a five-digit number assigned by MasterCard to a financial institution, third-party processor or other member to identify the member in the transaction.

Issuer

The card issuer, typically a financial organisation authorised to issue cards. The issuer has a direct relationship with the relevant card scheme.

M

Mastercard clearing cycle

Mastercard provides 6-8 clearing updates during each day, with details of financial transactions that are due for settlement.

Merchant

The shop or store providing a product or service that the cardholder is purchasing. A merchant must have a merchant account, provided by their acquirer, in order to trade. Physical stores use a terminal or card reader to request authorisation for transactions.

Online sites provide an online shopping basket and use a payment service provider to process their payments.

Merchant Category Code (MCC)

A unique identifier of the merchant, to identity the type of account provided to them by their acquirer.

MNE (Mastercard Networks Exchange)

A US PIN debit network provider for opening access to US debit networks.

P

PGP

Pretty Good Privacy (PGP) is an encryption system used for both sending encrypted emails and encrypting sensitive files.

Presentments

Stage in a transaction where the funds authorised on a card are captured (deducted from the cardholder's account). Also known as Clearing.

Programme Manager

A Thredd customer who manages a card programme. The programme manager can create branded cards, load funds and provide other card or banking services to their end customers.

R

reconciliation cycle

Thredd receive six cycles of settlement data from Mastercard.

reconciliation date

The system processing date associated with the settlement of funds, as provided by Mastercard.

S

SAFE Reporting

You can report fraudulent transactions to Mastercard by creating a new fraud event in Mastercom, using their SAFE reporting facility (now referred to as the Mastercard Fraud and Loss Database).

sFTP

Secure File Transfer Protocol. File Transfer Protocol (FTP) is a popular unencrypted method of transferring files between two remote systems. SFTP (SSH File Transfer Protocol, or Secure File Transfer Protocol) is a separate protocol packaged with SSH that works in a similar way but over a secure connection.

Smart Client

Smart Client is Thredd's user interface for managing your account on the Thredd Platform. Smart Client is installed as a desktop application and requires a secure connection to Thredd systems in order to be able to access your account.

SSL Certification

An SSL certificate displays important information for verifying the owner of a website and encrypting web traffic with SSL/TLS, including the public key, the issuer of the certificate, and the associated subdomains.

T

TLS

Transport Layer Security (TLS) is a security protocol that provides privacy and data integrity for Internet communications. Implementing TLS is a standard practice for building secure web apps.

U

UTC
