Section 1: Getting Started

You should read this section if you are new to GPS XML reports and want to understand what types of reports are available how they are provided.

Topics covered in this section:

- [About this Guide](#)
- [Introduction](#)
- [Transactional Data Files](#)
- [Transactional Data Schema](#)

Tip: To find out what has changed, see the [Document History](#).

1.1 About this Guide

This guide is intended as a reference guide, to provide information on the available GPS XML reports. it describes the Transaction XML Data Schema elements, sub-elements and attributes.

Target Audience

Technical team(s) responsible for the handling and processing of the GPS transaction XML files. You should have reasonable knowledge of XML/XSD and of the Cards industry.

What's Changed?

If you want to find out what's changed since the previous release, see the [Document History](#) section.

Other Documentation

Refer to the table below for a list of other relevant documents that should be used together with this guide.

Document	Description
Transaction Balance XML Guide	Describes the structure and content of the Transaction Balance XML report.
EHI Guide	Provides details of the GPS External Host Interface (EHI).
Smart Client Guide	Describes how to use the GPS Smart Client to manage your account.
Web Services Guide	Describes how to use the GPS web services API.

Tip: For the latest technical documentation, see the [Developer Portal](#).

1.2 Introduction

GPS provide a number of daily XML reports, containing details of transactions processed on the system during the past 24 hours.

This includes both authorisations and financial transactions.

Reports are provided by Secure File Transfer Protocol (sFTP).

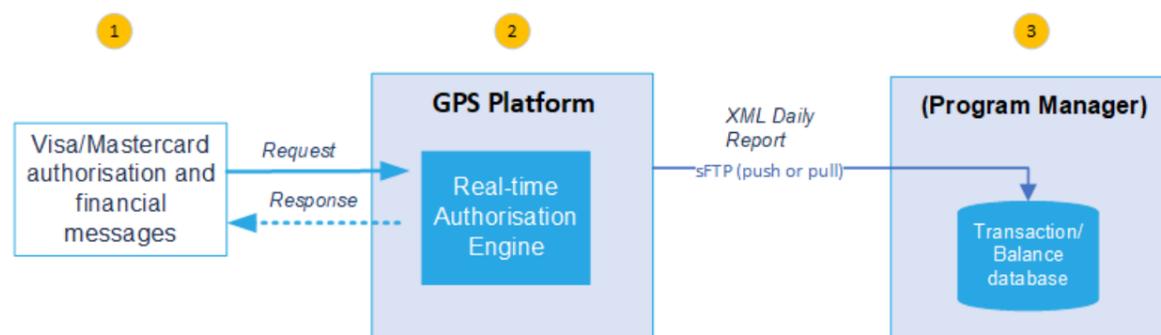

Figure: XML Reporting

Types of XML Reports

GPS provides the following daily reports to Program Managers:

- **Transaction XML Report** - containing details daily transactions
- **Balance XML Report** - provides details of the balance on each card

Transaction XML Report

The Transaction XML report provides details of authorisation and financial advices and any other non-scheme transactions that take place, such as card loads/unloads, balance adjustments (via web services), cardholder fees generated by GPS (you have set up in your fee groups), network scheme fees.

You can use this report to reconcile against Mastercard or Visa settlement advices.

You can also use it to reconcile with data received from EHI.

The format and content of the transaction XML report is described in this guide.

Balance XML Report

The Balance XML report provides details of the balance on each card as at midnight UK time or the time when the XML is run (configurable). You can use this report to confirm how much money is on the card according to GPS system's (where GPS maintain the balance). You can compare this to information you hold in your local card database. For more information, see the [Balance XML Reporting Guide](#).

1. 3 Transactional Data Files

GPS can supply you with daily Transaction XML files. Transactional XML files are delivered to you via sFTP. The transaction XML file is uploaded to the GPS sFTP server from where you can pull it, or we can also configure the file to be pushed to your sFTP server.

Note: sFTP files are deleted from the GPS sFTP server after two days. They are stored on our archive server for a limited period.

Sending of Files

Transactional data files are created every day (excluding UK Public Holidays). When we have received the settlement information from the card scheme, we send this to you. For UK issuers, this is in the afternoon, between 2:30-5pm, UK time. For issuers in other regions, the timings may vary.

Mastercard Cycles

Mastercard have 6 cycles clearing cycles per day, excluding weekends. After each clearing cycle, Mastercard send us clearing files, which contain the settlement data.

We wait until we process all 6 cycles before generating the transaction XML report. We send you a single daily file.

Data from cycles 5-6 from the night before and 1-4 from current day form a complete settlement day picture for most regions. These contain all the information you need to reconcile your settlements with Mastercard.

Asia-Pacific

For Asia-Pacific clients we process cycles 2-6 for the previous day and cycle 1 from the current day, and include them in the daily transaction XML report.

Visa Cycles

Visa only provide one file per day (per Visa reporting BIN), which contains the batched files for that day.

After processing, we will create the transaction XML file and send to you.

File Contents

The daily transaction XML file contains:

- All presentments that have a settlement date of this day (D)
- Any presentments that have a settlement date of day D-1 and arrived too late for the previous day's XML generation

- All non-presentment transactions for day D-1.

File Format and Encryption

For an example of a transaction XML file, see [Transaction XML Example](#).

File Naming Convention

The transaction XML files use the following naming convention:

`GPS-PPPtznexpYYYYMMDD.xml`

Where:

- PPP= name of the Program Manager
- YYYY= year (4 digits)
- MM = month (2 digits)
- DD = day (2 digits)

For example:

`GPS-NWCtnexp20100131.xml`

Encryption

XML files are encrypted using PGP, which requires sharing of keys. For details, contact your implementation manager.

Encoding / Type

Transaction XML data files are well-formed XML (UTF-8 encoded).

Note: XML is case-sensitive, ensure you follow the correct casing for all XML elements and attribute names when processing the message.

1.4 Transactional Data Schema

The Transactional Data Schema (TDS) describes the structure and possible data values of the GPS Transactional XML file.

You can validate the transaction XML files you receive against the Schema (XSD file) to check it is in the correct format.

The TDS is an evolving standard and is subject to change as the standard evolves. When we make changes to the TDS, we will implement a new version and notify you.

Schema Versions

The schema is not publically available. GPS sends schema files when a new version of the XML is published. The schema filename indicates the schema version number. The schema file contains a comments section with details of version changes.

For an example of the current Transactional Data Schema, see [Transaction XML Schema](#).

For a history of changes to the Transactional Data Schema, see [Schema Changes](#).

Schema Elements

An XML file conforming to the schema consists of the following elements:

- [Primary elements](#)
- [Sub-elements and attributes](#)

Section 2: Primary Elements

2.1 Primary Elements

Primary Elements are listed within a [<Transactions>](#) parent element, which defines the top-level entities of the message. See the table below for details.

Element Name	Description	Data Type	Occurs
CardAuthorisation	Describes an authorised Authorisation or Reversal.	<CardAuthorisation>	0 - n
CardFinancial	Describes a Financial Advice or Financial Reversal.	<CardFinancial>	0 - n
CardChrgBackRepRes	Describes a Chargeback, Chargeback Reversal, Representment or Representment Reversal.	<CardChrgBackRepRes>	0 - n
CardFee	Describes a fee (and commission).	<CardFee>	0 - n
MasterCardFee	Describes a MasterCard fee.	<MasterCardFee>	0 - n
CardLoadUnload	Described a Card Load, Card Load Reversal, Card Unload and Card Unload Reversal.	<CardLoadUnload>	0 - n
ApprovedAgencyBanking	Describes an approved Agency Banking transaction (relevant only if you are using the Agency Banking service)	<ApprovedAgencyBanking>	0 - n
DeclinedAgencyBanking	Describes declined Agency Banking transaction (relevant only if you are using the Agency Banking service)	<DeclinedAgencyBanking>	0 - n
AgencyBankingFee	describe any bank charges applied to Agency Banking transaction (relevant only if you are using the Agency Banking service)	<AgencyBankingFee>	0 - n
CardBalAdjust	Describes a card account Balance Adjustment or Reversal.	<CardBalAdjust>	0 - n
CardEvent	Describes a card status change event.	<CardEvent>	0 - n

Note: The presence of primary elements within an XML message depends on the card activity for the period being reported. For example, [<CardChrgBackRepRes>](#) elements are only present when a chargeback (or reversal) or Representment (or reversal) is reported.

2.2 CardAuthorisation

CardAuthorisation provide details of payment authorisation advices. There are two types of CardAuthorisation records:

- Authorisation Advice
- Authorisation Reversal

You can use the [RecType](#) element to determine the type of record.

You can use the [AuthId](#) element to uniquely identify the record and distinguish it from all other CardAuthorisation records.

Child Element	Description	Data Type	Required	Constraints / Permitted Values
RecType	Record type, indicates <i>Advice</i> or <i>Reversal</i> .	<RecType>	Yes	See the RecType sub-element
AuthId	Unique identifier for this CardAuthorisation record.	xs:unsignedLong	Yes	0 to 18,446,744,073, 709, 551,615
AuthTxnId	Alternative unique identifier of a CardAuthorisation record.	xs:unsignedInt	Yes	0 to 4,294,967,295
LocalDate	The date and time the record was generated by the terminal (POS or ATM) or acquirer.	<LocalDate>	Yes	See the LocalDate sub-element
SettlementDate	The date the transaction was processed.	<SettlementDate>	Yes	See the SettlementDate sub-element
Card	Details of the card used in the transaction.	<Card>	Yes	See the Card sub-element
Account	Details of the cardholder account.	<Account>	Yes	See the Account sub-element
TxnCode	Indicates the type of transaction.	<TxnCode>	Yes	See the TxnCode sub-element
TxnAmt	Indicates the value of the transaction requested by the cardholder.	<BasicAmount>	Yes	See the TxnAmt sub-element
CashbackAmt	Details of cashback requested by the cardholder.	<BasicAmount>	Yes	See the CashbackAmt sub-element
BillAmt	The amount posted to the cardholder account. This DOES NOT include interchange.	<RateAmount>	Yes	See the BillAmt sub-element
ApprCode	The Approval Code generated by the issuer and printed on the receipt.	<ApprCode>	Yes	See the ApprCode sub-element

Child Element	Description	Data Type	Required	Constraints / Permitted Values
Trace	Information used to uniquely identify the transaction.	<Trace>	Yes	See the Trace sub-element
MerchCode	A unique code identifying the Merchant (also known as the <i>Card Acceptor Identifier</i>).	<MerchCode>	Yes	See the MerchCode sub-element
Term	Describes the terminal used for the transaction.	<Term>	Yes	See the Term sub-element
Schema	Indicates the name of the card scheme.	<Schema>	Yes	See the Schema sub-element
Txn	Describes the validation and authentication properties used in a transaction.	<Txn>	Yes	See the Txn sub-element
MsgSource	Describes the derivative source of the record.	<MsgSource CardAuthorisation>	Yes	See the MsgSource sub-element
PaddingAmt	The amount of padding applied to the authorisation, whereby "padding" is defined as the amount by which the Authorisation is Greater than the corresponding Financial Transaction.	<BasicAmount>	Yes	See the PaddingAmt sub-element
Rate_Fee	The amount of any rate-based POS or ATM fee that was charged.	xs:decimal	Yes	
Fixed_Fee	The amount of any fixed POS or ATM fee that was charged.	xs:decimal	Yes	
CommissionAmt	The amount of commission applied to the authorisation, whereby "commission" is defined as an indication of the charges applicable to the corresponding Financial Transaction.	<BasicAmount>	Yes	See the CommissionAmt sub-element
Classification	Merchant classification.	<Classification>	Yes	See the Classification sub-element
Response	Indicates transaction approval.	<Response>	Yes	See the Response sub-element
OrigTxnAmt	The value of the original transaction amount requested by the cardholder; only used in CardAuthorisation reversals.	<PartialAmount>	If Applicable	Only applicable if the RecType is "REV", See the OrigTxnAmt sub-element
ReversalReason	The reason for the reversal; only used in CardAuthorisation reversals.	<ReversalReason>	If Applicable	Only applicable if the RecType is "REV". See the ReversalReason sub-element
Sender	Provides details of the sender of the payment, where there is a money transfer.	<Sender>	If Applicable	See the Sender sub-element
Receiver	Provides details of the receiver of the payment, where there is a money transfer.	<Receiver>	If Applicable	See the Receiver sub-element
FXConv	Provides details of the Foreign Exchange (FX) rate conversion in a CurrencyCloud transaction. This can be used to reconcile the POS transaction FX movements, if any was done.	<FXConv>	If Applicable	See the FXConv sub-element.

2.3 CardBalAdjust

CardBalAdjust records are used to indicate balance adjustments to a card's account.

You can use the [AdjustId](#) element to uniquely identify the record and distinguish it from all other CardBalAdjust records.

Child Element	Description	Data Type	Required	Constraints/ Permitted Values
LocalDate	The date and time the record was generated by the terminal (POS or ATM) or acquirer.	<LocalDate>	Yes	See the LocalDate sub-element
AdjustId	Identifier of this adjustment.	xs:unsignedLong	Yes	0 to 18,446,744,073,709,551,615
MessageId	Message identifier supplied in the request for this adjustment.	xs:unsignedInt	If Applicable	0 to 4,294,967,295
SettlementDate	The date the transaction has been processed.	<SettlementDate>	Yes	See the SettlementDate sub-element
Card	Details of the card used in the transaction.	<Card>	Yes	See the Card sub-element
Account	Details of the cardholder account.	<Account>	Yes	See the Account sub-element
Amount	The amount, currency and direction (debit/credit) for the load and unload.	<DirectionAmount>	Yes	See the Amount sub-element
VoidedAdjustId	Identifier of the balance adjustment reversed/voided by this item. Only appears if there is a reversal.	xs:unsignedInt	If Applicable	0 to 4,294,967,295
MerchCode	A unique code identifying the Merchant (also known as the Card Acceptor Identifier)	<MerchCode>	Optional	See the MerchCode sub-element
Desc	A text description of the unload.	<Desc>	Yes	See the Desc sub-element
AdjustType	The type of adjustment: <i>Actual</i> or <i>Block</i> .	<AdjustType>	Yes	See the AdjustType sub-element

Example

```

</CardBalAdjust>
```

2.4 CardChrgBackRepRes

The CardChrgBackRepRes describes the following record types:

- Chargeback Advice
- Chargeback Reversal
- Representment Advice
- Representment Reversal

You can use the [AdjustId](#) element to uniquely identify the record and distinguish it from all other CardChrgBackRepRes records.

Child Element	Description	Data Type	Required	Constraints / Permitted Values
RecordType	Indicates the type of CardChrgBackRepRes record.	xs:string	Yes	Valid values are: CB = Chargeback Advice CBREV = Chargeback Reversal REPRES = Representment Advice REPRESREV = Re-epresentment Reversal
ChgbackRepresId	Unique identifier for this CardChrgBackRepRes record.	xs:unsignedLong	Yes	0 to 18,446,744,073, 709, 551, 615
LocalDate	The date and time the record was generated by the terminal (POS or ATM) or acquirer.	<LocalDate>	Yes	See the LocalDate sub-element
SettlementDate	The date the transaction has been processed.	<SettlementDate>	Yes	See the SettlementDate sub-element
Card	Details of the card used in the transaction.	<Card>	Yes	See the Card sub-element
Account	Details of the cardholder account.	<Account>	Yes	See the Account sub-element
TxnCode	Indicates the type of transaction.	<TxnCode>	Yes	See the TxnCode sub-element
TxnAmt	Indicates the value of the transaction requested by the cardholder.	<BasicAmount>	Yes	See the TxnAmt sub-element
CashbackAmt	Details of any cashback amount requested by cardholder, if no cashback is requested then populate with a zero value and the transaction currency code .	<BasicAmount>	Yes	See the CashbackAmt sub-element

Child Element	Description	Data Type	Required	Constraints / Permitted Values
BillAmt	The amount posted to the cardholder account. This DOES NOT include interchange.	<RateAmount>	Yes	See the BillAmt sub-element
ApprCode	The <i>approval code</i> generated by the issuer and printed on the receipt.	<ApprCode>	Yes	See the ApprCode sub-element
Trace	Information used to uniquely identify the transaction.	<Trace>	Yes	See the Trace sub-element
MerchCode	A unique code identifying the Merchant (also know as the <i>Card Acceptor Identifier</i>).	<Merch Code>	Yes	See the MerchCode sub-element
Term	Describes the terminal used for the transaction.	<Term>	Yes	See the Term sub-element
Schema	Indicates the name of the card scheme.	<Schema>	Yes	See the Schema sub-element
Txn	Describes the validation / authentication properties used in a transaction.	<Txn>	Yes	See the Txn sub-element
MsgSource	Describes the derivative source of the record.	<MsgSource>	Yes	See the MsgSource sub-element
Repeat	Information to show the number of the chargeback-/representation.	xs:unsigned Byte	Yes	Valid values are: 1 = First chargeback / representation 2 = Second Chargeback / representation Note: MasterCard and Visa no longer support 2nd representation.
SettlementAmt	The amount posted to the settlement account.	<SettlementAmt>	Yes	See the Settlement sub-element
Fee	Interchange or service fee amount posted to the settlement account.	<DirectionAmount>	Yes	See the Fee sub-element
ARN	Acquirer Reference Number.	<ARN>	Yes	See the ARN sub-element
FIID	Forward Institution Identification code.	<FIID>	Yes	See the FIID sub-element
RIID	Receiving Institution Identification code.	<RIID>	Yes	See the RIID sub-element
ReasonCode	Message reason code.	xs:string	Yes	See Message Reason Codes
Classification	Merchant classification for the transaction.	<Classification>	Yes	See the Classification sub-element
OrigTxnAmt	Original transaction amount. The value of the original transaction requested by the cardholder. This is used in the case of the transaction being a partial chargeback/representation, chargeback reversals or representation reversals.	<PartialAmount>	If applicable	See the OrigTxnAmt sub-element
PartialReversal	Indicates if the amount reversed is a partial amount of the original chargeback.	Xs:boolean	If applicable	Valid values are: true = Partial Reversal; false = Full Reversal If not supplied, assumes "false".
SettlementCycle	Shows the settlement cycle for the chargeback.	<SettlementCycle>	Yes	See the SettlementCycle sub-element
ReconciliationDate	Shows the reconciliation date for the chargeback.	<ReconciliationDate>	Yes	See the ReconciliationDate sub-element
ReconciliationCycle	Shows the reconciliation cycle for the chargeback.	<ReconciliationCycle>	Yes	See the ReconciliationCycle sub-element
Usage	Indicates whether the chargeback is manually credited to the card.	<Usage>	Yes	See the Usage sub-element
Pending_Billing_Amount	Value of the chargeback billing amount.	< Pending_Billing_Amount>	Yes	See the Pending_Billing_Amount sub-element

Child Element	Description	Data Type	Required	Constraints / Permitted Values
SettlementIndicator	Indicator for <i>Domestic</i> or <i>International</i> settlement.	SettlementIndicator	If applicable	See the SettlementIndicator sub-element
Additional_Amt_DE54	Additional amounts field where additional fees such as card network fees are held.	<Additional_Amt_DE54>	If applicable	See the Additional_Amt_DE54 sub-element
ChargebackRefNum	Chargeback reference number, as displayed in Smart Client.	< ChargebackRefNum>	If applicable	See the ChargebackRefNum sub-element

2.5 CardFee

The CardFee primary element is used to describe Card Fee records. Distinguishing between the permissible types is achieved using the FeeClass child element as described below.

Child Element	Description	Data Type	Required	Constraints / Permitted Values
CardFeeId	Identifier for this CardFee Record. Not necessarily unique. If there is a non-domestic fee and an FX fee on the same transaction, they will share the same CardFeeId .	xs:unsignedLong	Yes	0 to 18,446,744,073,709, 551, 615
LocalDate	The date and time the record was generated by the terminal (POS or ATM) or acquirer.	<LocalDate>	Yes	See the LocalDate sub-element
SettlementDate	The date when the transaction has been processed.	<Settlement Date>	Yes	See the SettlementDate sub-element
Card	Details of the card to which the fee relates.	<Card>	Yes	See the Card sub-element
Account	Details of the cardholder account to which the fee relates.	<Account>	Yes	See the Account sub-element
Txid	If applicable - the FinId of the related CardFinancial (transaction) record for this CardFee Record (foreign key).	xs:unsignedLong	Yes	0 to 18,446,744,073,709,551, 615 If not applicable, use default value 0
TxnCode	Indicates the type of transaction.	<TxnCode>	No	See the TxnCode sub-element
MerchCode	A unique code identifying the Merchant (also known as the <i>Card Acceptor Identifier</i>)	<MerchCode>	No	See the MerchCode sub-element
MsgSource	Describes the derivative source of the record.	<MsgSource>	No	See the MsgSource sub-element
FeeClass	Describes the derivation and nature of the fee.	<FeeClass>	Yes	See the FeeClass sub-element
LoadUnloadId	If applicable - the LoadUnloadId of the related CardLoadUnload record for this CardFee Record (foreign key).	xs:unsignedLong	If Applicable	0 to 18,446,744,073,709,551, 615
Desc	Fee description.	<Desc>	Yes	See the Desc sub-element
FeeAmt	Only use when "FeeClass" "type" attribute is 0, and when this is the case the FeeAmt represents the fee in the currency as dictated by Mastercard charging.	<Direction Amount>	If Applicable	See the FeeAmt sub-element
Amt	This amount is described as follows: <ul style="list-style-type: none"> For Settlements (see FeeClass: "type" = 0,2,4 and 5), this is the settlement amount posted to the settlement account. 54	Visa International.																			
domesticMaestro	Indicates Domestic Maestro	<domesticMaestro>	Yes	See domesticMaestro .																

Example

```
<MsgSource value="67"domesticMaestro="no"></MsgSource>
```

OrigTxnAmt

This **OrigTxnAmt** element describes the original transaction amount requested by the cardholder.

Attribute	Description	Data Type	Required	Constraints / Permitted Values
value	The value of the original transaction.	xs:decimal	Yes	Decimal value.
currency	The currency code of the original transaction.	xs:unsignedShort	Yes	See ISO Currency Codes .
partial	Indicates a partial amount.	<YesNoString>	If applicable	Valid values are: <ul style="list-style-type: none"> • yes • no If not supplied, assumes "no".
origItemid	The system trace audit number of the original authorisation, as assigned by the message originator. This can be used to link an authorisation reversal to the original authorisation.	xs:unsignedInt	If applicable	0 to 4,294,967,295

Example

```
<OrigTxnAmt value="0.95"currency="826" partial="yes"origItemid="123456"></OrigTxnAmt>
```

PaddingAmt

The **PaddingAmt** element describes the value of any padding amount applied to an authorisation. This is typically used to mitigate against FX rate fluctuations between the authorisation and the settlement.

Attribute	Description	Data Type	Required	Constraints / Permitted Values
value	The value of the padding amount.	xs:decimal	Yes	Decimal value.
currency	The 3 digit ISO standard currency code	xs:unsignedShort	Yes	Short value.

Example

```
<PaddingAmt value="0.95"currency="826"></PaddingAmt>
```

Pending_Billing_Amount

The **Pending_Billing_Amount** element shows the value of the pending Chargeback amount.

Description	Data Type	Constraints / Permitted Values
Chargeback amount.	xs:decimal	Decimal value.

Example

```
<Pending_Billing_Amount>10.25</Pending_Billing_Amount>
```

Recon

The **Recon** element provides details of the reconciliation date and clearing cycle.

Attribute	Description	Data Type	Required	Constraints / Permitted Values
date	Date the original transaction was reconciled.	xs:string	Optional	Maximum 8 characters. Date in the format: YYYYMMDD
cycle	Indicates which of the six Mastercard clearing cycles the transaction was processed in.	xs:string	Optional	Values 01 - 06.

Example

An example of a settlement which occurred in cycle 1 on 9th September 2017 is shown below.

```
<Recon date="20170911" cycle="01"/></recon>
```

Receiver

The **Receiver** element provides details of the receiver of the payment where there is a money transfer. See also [Sender](#).

```

ReconciliationDate

The **ReconciliationDate** element shows the reconciliation date of a Chargeback record.

Description	Data Type	Constraints / Per
Reconciliation date of Chargeback record.	xs:string	Maximum 8 characters, Date in the format: YYYYMMDD

Example

```
<ReconciliationDate>20200325</ReconciliationDate>
```

ReconciliationCycle

The **ReconciliationCycle** element shows the reconciliation cycle of the Chargeback record.

Description	Data Type	Constraints / Permitted Values
Reconciliation cycle of Chargeback record.	xs:string	Maximum 2 characters, Possible values are 01,02,03,04,05 and 06.

Example

```
<ReconciliationCycle>03</ReconciliationCycle>
```

RecordType

The **RecordType** element is used to distinguish between different fee types. (Relevant to Mastercard only)

Description	Base Data Type	Constraints / Permitted Values								
This can have different values depending on the primary element. For example: For a chargeback, where the value of RecordType is <i>MCB</i> , to find out the chargeback fee amount, refer to the fee amount (<FeeAmt>) of the MasterCardFee record. To view the original chargeback amount, refer to the <BillAmt> in the CardChrgBackRepRes record. For case filing, where the value of RecordType is <i>MCF</i> , refer to the MasterCardFee record for details of pre-arbitration and arbitration case filing fees.	xs:string	Maximum length 3.								
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>FC</td> <td>From FeeCollection</td> </tr> <tr> <td>MCB</td> <td>Mastercom Chargebacks. Raised either via Mastercom UI or Mastercom SmartClient API.</td> </tr> <tr> <td>MCF</td> <td>Mastercom pre-arbitration or arbitration case filing. Raised either via Mastercom UI or Mastercom Smartclient API.</td> </tr> </tbody> </table>	Value	Description	FC	From FeeCollection	MCB	Mastercom Chargebacks. Raised either via Mastercom UI or Mastercom SmartClient API.	MCF	Mastercom pre-arbitration or arbitration case filing. Raised either via Mastercom UI or Mastercom Smartclient API.
		Value	Description							
		FC	From FeeCollection							
MCB	Mastercom Chargebacks. Raised either via Mastercom UI or Mastercom SmartClient API.									
MCF	Mastercom pre-arbitration or arbitration case filing. Raised either via Mastercom UI or Mastercom Smartclient API.									

Example

```
<RecordType>MCF</RecordType >
```

RecType

The **RecType** element describes whether this record is an advice or a reversal.

Permitted Value	Description	Data Type
ADV	Advice Record	xs:string
REV	Reversal Record	xs:string

Example

```
<RecType>ADV</RecType>
```

Response

The **Response** element describes the approval status of a transaction request.

Attribute	Description	Data Type	Required	Constraints / Permitted Values
approved	Approval component.	<approved>	Yes	See approved .
actioncode	Approval component.	xs:string	If applicable	For CardAuthorisation Advice Records action code of "0" and response code ="00" indicates the transaction was approved. For CardAuthorisation Reversal Records action code of "4" and response code of "00" indicates the acquirer/network-generated reversal was approved. However, action code of "0" and response code of "00" indicates an issuer timeout (system generated) reversal was approved. Other value combinations indicate the transaction was rejected. Applies to CardAuthorisation and CardFinancial only.
responsecode	Approval component.	xs:string	If applicable	
additionaldesc	Extra information	xs:string	If applicable	Maximum 500 characters. Applies to CardAuthorisation only.

Example

```
<Response approved="yes"actioncode="0"responsecode="00"></Response>
```

ReversalReason

The **ReversalReason** element describes the reason for a reversal.

Permitted Value	Description	Data Type
0	Original authorisation was matched, i.e., cancel the original Authorisation value from the BLKAMT field (thereby increasing the AMTAVL balance) because a settlement transaction has been matched and processed. This code would be used if the CardAuthorisation's AuthId is populated in the matching CardFinancial's Child Element AuthId.	xs:string
1	Original authorisation has expired, i.e., Cancel the original Authorisation value from the BLKAMT field (thereby increasing the AMTAVL balance) even though a settlement transaction has not been identified before the expiry of the Authorisation time limit. This code would be used if the CardAuthorisation's AuthId is not present in any CardFinancial's Child Element AuthId.	xs:string
2	Manually deleted, i.e., merchant erroneously processed Authorisation and reversal is processed directly into the processor's system.	xs:string
3	Online reversal, i.e., merchant erroneously processed Authorisation and reversal is entered via the processor's online portal.	xs:string

Example

```
<ReversalReason>0</ReversalReason>
```

RIID

The **RIID** element describes the Receiving Institution Identification Code (RIID). This is the Program Manager's ICA as provided by Mastercard or the equivalent account code from Visa.

Description	Base Data Type	Constraints / Permitted Values
Receiving Institution Identification Code	xs:string	Alphanumeric, maximum 11 characters.

Example

```
<RIID>00000000123</RIID>
```

Schema

The **Schema** element describes the name of the card scheme processing the transaction. For example: Visa (VISA), Mastercard (MCRD).

Permitted Value	Description	Data Type
CIRR	Euro Cirrus	xs:string
ECRD	EuroCard	xs:string
MAES	Maestro	xs:string

Permitted Value	Description	Data Type
CIMA	Cirrus Maestro	xs:string
MCRD	Mastercard	xs:string
VISA	Visa	xs:string
PLUS	PLUS Card	xs:string

Example

```
<Schema>MCRD</Schema>
```

Sender

The **Sender** element provides details of the sender of the payment, where there is a money transfer. See also [Receiver](#).

Attribute	Description	Data Type	Required	Constraints / Permitted Values																				
firstname	FirstName	xs:string	Optional	Alphanumeric, maximum 99 characters.

```

Settlement

The **Settlement** element describes the Settlement details.

Attribute	Description	Data Type	Required	Constraints / Permitted Values
date	Date the original transaction was settled	xs:string	Optional	Maximum 8 characters, Date in the format: YYYYMMDD
cycle	Indicates which of the six Mastercard clearing cycles the transaction was processed in.	xs:string	Optional	Values 01 - 06.

Example

An example of a Settlement which occurred in cycle 1 on 9th September 2017 is shown below.

```
<Settlement date="20170911" cycle="01"/></Settlement>
```

SettlementAmt (Mastercard only)

The **SettlementAmt** element describes the settlement amount.

Note: Only Mastercard send a Settlement Amount. For VISA, SettlementAmt will be the same as the Cardholder Billing amount (**BillAmt**).

Attribute	Description	Data Type	Required	Constraints / Permitted Values
value	The value of the settlement amount.	xs:decimal	Yes	Decimal value.
currency	The 3 digit ISO code of currency that the transaction will be settled in.	xs:unsigned Short	Yes	See ISO Currency Codes .
rate	The conversion rate used to calculate the settlement amount value.	<Rate>	Yes	Decimal value, maximum 6 decimal places, using conventional rounding down (1-4) and up (5-9).
date	Date the original transaction was settled.	xs:string	If applicable	Maximum 8 characters, Date in the format: YYYYMMDD Only required for chargebacks and representments.

Example

The example below represents 10 GBP at an exchange rate of 1:1.

```
<SettlementAmt value="10.00" currency="826" rate="1.000000"
date="20100825"></SettlementAmt>
```

SettlementCycle

The **SettlementCycle** element describes the settlement cycle of the Chargeback record.

Description	Data Type	Constraints / Permitted Values
Settlement cycle of a Chargeback record.	xs:string	Maximum length 2 characters. Possible value: 01.

Example

```
<SettlementCycle>01</SettlementCycle>
```

SettlementDate

The **SettlementDate** element describes the date when the transaction will be settled.

Note: in the **CardAuthorisation** element, this field only provides the GPS transaction date.

Description	BaseType	Constraints / Permitted Values
Date (UTC)	xs:string	Maximum 8 characters, date in the format: YYYYMMDD

Example

```
<SettlementDate>20100125</SettlementDate>
```

SettlementIndicator

The **SettlementIndicator** element describes the type of settlement service, for example whether this is International or clearing-only.

Description	Base Data Type	Constraints / Permitted Values								
The type of settlement service	xs:string	Maximum length 1. Values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>International settlement service.</td> </tr> <tr> <td>3</td> <td>Clearing-only (valid only for countries with defined service).</td> </tr> <tr> <td>8</td> <td>National Net settlement service (valid only for countries with defined service).</td> </tr> </tbody> </table>	Value	Description	0	International settlement service.	3	Clearing-only (valid only for countries with defined service).	8	National Net settlement service (valid only for countries with defined service).
Value	Description									
0	International settlement service.

		9	BASEII selects the appropriate settlement service based on routing and country-defined default. (Visa Only)

Example

```
<SettlementIndicator>0</SettlementIndicator>
```

SchemeSettlementDate

The **SchemeSettlementDate** element describes the scheme first presentment settlement date in a financial advice or reversal. The data contained in this element is taken from the following data sources received from Mastercard and set by GPS for Visa:

- Mastercard - DE48 PDS0159 subfield 8
- Visa - GPS settlement date

Description	BaseType	Constraints / Permitted Values
Date (UTC)	xs:string	Maximum 8 characters, date in the format: YYYYMMDD.

Example

```
<SchemeSettlementDate>20100125</SchemeSettlementDate>
```

Term

The **Term** element provides details of the terminal used in a POS card transaction.

Attribute	Description	Data Type	Required	Constraints/Permitted Values.
code	Card acceptor terminal ID (Mastercard DE 41 field). This is a unique code identifying a terminal at the card acceptor location.	<code>	Yes	See code
location	Location - defines the site where the terminal is located. It can be a branch code or store name.	xs:string	Yes	Maximum 64 characters
street	Street - description of the terminal street location.	xs:string	Yes	Maximum 64 characters

Attribute	Description	Data Type	Required	Constraints/Permitted Values.
city	City	xs:string	Yes	Maximum 64 characters
country	Country code - ISO code.	xs:string	Yes	Must be 2 Characters. See ISO Country Codes .
inputcapability	The primary capability of the terminal for entering card information.	<inputcapability>	Yes	see PDS0105
authcapability	This is the method available to verify the cardholder at this terminal.	<authcapability>	Optional	see authcapability

Example

```
<Term code="N376131"location="A BANK"street="A STREET"city="A CITY"
country="GB"inputcapability="5"authcapability="1"></Term>
```

Trace

The **Trace** element provides an audit number that can be used to uniquely identify a transaction.

Attribute	Description	Data Type	Required	Constraints / Permitted Values
auditno	Card scheme system Trace Audit Number. Contains a number that uniquely identifies a transaction. The audit number remains unchanged for all messages within the life of the transaction (i.e. original and reversal). For partial reversals, a new Audit Number is required.	xs:string	Yes	Alphanumeric, maximum 6 characters
origauditno	This is only populated if the containing record is a reversal, and represents information regarding the original transaction.	xs:string	Optional	Alphanumeric, maximum 6 characters
Retrefno	Retrieval Reference Number. Contains a document reference supplied by the system retaining the original source information (ATM acquirer) and is used to assist in locating that information or a copy thereof.	xs:string	Yes	Alphanumeric, maximum 12 characters

Example

```
<Trace auditno="1234"origauditno="345"Retrefno="AN1234"></Trace>
```

Txn

The **Txn** element describes how a transaction was validated and authenticated.

Attribute	Description	Data Type	Required	Constraints / Permitted Values
cardholderpresent	Indicates whether the cardholder present during the transaction.	<cardholderpresent>	Yes	see cardholderpresent .
cardpresent	Indicates whether the card was present during the transaction.	<cardpresent>	Yes	See cardpresent .
cardinputmethod	The method used to input the information from the card to the terminal.	<cardinputmethod>	Yes	see cardinputmethod .
cardauthmethod	The cardholder authentication method used in a card transaction.	<cardauthmethod>	Yes	see cardauthmethod .
cardauthentity	The component or person who verified the cardholder identity as reported in the cardauthmethod field.	<cardauthentity>	Yes	see cardauthentity .
TVR	Terminal Verification Results. This is the 10 hexadecimal characters representing the TVR 5 binary bytes. This field should only be interpreted for EMV transactions (Cardauthentity and Cardinputmethod).	xs:unsigned Long	If applicable	This field is only present in financial advices if the acquirer systems provide Chip data Default value is zero.

Example

```
<Txn cardholderpresent="0"cardpresent="1"cardinputmethod="2"
cardauthmethod="3"cardauthentity="3"TVR="0"></Txn>
```

TxnAmt

The **TxnAmt** element describes a transaction amount (value and currency).

Attribute	Description	Data Type	Required	Constraints / Permitted Values
value	The value of the transaction amount.	xs:decimal	Yes	Decimal value.
currency	The transacted currency code.	xs:unsignedShort	Yes	See ISO Currency Codes .

General FAQs

This section provides answers to frequently asked questions.

XML Reports

What type of XML reports does GPS provide?

GPS provides the following reports to Program Managers:

- Transaction XML report
- Balance XML report

Can I configure the details provided in each report?

The GPS reports are standard. If you require bespoke reports, please speak to your account manager.

How often are reports provided? Can I change this?

The GPS reports are provided daily. If you require a bespoke report frequency, please speak to your account manager.

For more frequent transaction information, we recommend you use the External Host Interface (EHI) which provides transaction reporting in real-time.

How are reports provided to customers?

The daily XML reports are provided via sFTP. Depending on your requirements, this can be on a Push or a Pull basis.

How often do you change the fields in the report?

GPS will add new fields to the report in line with updates from the card schemes (Visa and Mastercard) or to reflect other changes relevant to the payments industry or our service.

When we make changes to the XML reports, we will update the technical documentation and notify you of the change.

Are reports encrypted?

Yes. Reports are encrypted using the PGP standard.

How do I identify the version of the XML report?

The XML schema version is listed in the comments section of the schema, together with details of what has changed. See [Transaction XML Schema.htm](#). We currently do not provide the XML version within the XML report.

How large is a typical report?

This is based on the number of your transactions and can be anything from 1Kb to 2GB. We will split up anything larger than 2GB into smaller files: eg., *filename.001*, *filename.002* and so on.

Do you store reports and if so, for how long?

Reports are stored for up to 2 days on the sFTP server, after which they are deleted from the sFTP server. We keep an archive of historical files for a limited period. For access to historical files, please raise a JIRA request.

How can I use the XML reports?

You can use them to do the following:

- Update to your transactions database
- For transaction reconciliation purposes

Glossary

This page provides a list of glossary terms used in this guide.

3

3D Secure

3D Secure (3-domain structure), also known as a payer authentication, is a security protocol that helps to prevent fraud in online credit and debit card transactions. This security feature is supported by Visa and Mastercard and is branded as 'Verified by Visa' and 'Mastercard SecureCode' respectively.

A

Acquirer

The merchant acquirer or bank that offers the merchant a trading account, to enable the merchant to take payments in store or online from cardholders.

Authentication

This includes checks to confirm the cardholder identity, such as PIN, CVV2 and CAVV.

Authorisation

Stage where a merchant requests approval for a card payment by sending a request to the card issuer to check that the card is valid, and that the requested authorisation amount is available on the card. At this stage the funds are not deducted from the card.

Automated Fuel Dispenser (AFD)

Automatic fuel dispensers (AFDs) are used at petrol or gas stations for customer self-service fuel payments. Typically the customer inserts their card and enters a PIN number and the AFD authorises a fixed amount (e.g. £99). Once the final payment amount is known, the AFD may reverse the authorisation and/or request a second authorisation.

C

Card Scheme

Card network, such as MasterCard or Visa, responsible for managing transactions over the network and for arbitration of any disputes.

Chargeback

Where a cardholder disputes a transaction on their account and is unable to resolve directly with the merchant, they can raise a chargeback with their card issuer. The chargeback must be for a legitimate reason, such as goods and services not received, faulty goods, or a fraudulent transaction.

Clearing File/Clearing Transaction

GPS receive batch clearing files from the card networks, containing clearing transactions, such as presentments and network fees. The card issuer transfers the requested settlement amount to the acquirer and 'clears' the amount on the card, reducing the available card balance accordingly.

E

EMV

EMV originally stood for "Europay, Mastercard, and Visa", the three companies which created the standard. EMV cards are smart cards, also called chip cards, integrated circuit cards, or IC cards which store their data on integrated circuit chips, in addition to magnetic stripes for backward compatibility.

External Host

The external system to which GPS sends real-time transaction-related data. The URL to this system is configured within GPS per programme or product. The Program Manager uses their external host system to hold details of the balance on the cards in their programme and perform transaction-related services, such as payment authorisation, transaction matching and reconciliation.

External Host Interface (EHI)

The External Host Interface provides a facility to enable exchange of data between GPS and external systems via our web services. All transaction data processed by GPS is transferred to the External Host side via EHI in real time. For certain types of transactions, such as Authorisations, the External Host can participate in payment transaction authorisation.

F

Fee Groups

Groups which control the card transaction authorisation fees, and other fees, such as recurring fees and GPS web service API fees.

H

Hanging Filter

The period of time during which GPS waits for an approved authorisation amount to be settled. This is defined at a GPS product level. A typical default is 7 days for an auth and 10 days for a pre-auth.

I

ICA

The Interbank Card Association Number (ICA) is a five-digit number assigned by MasterCard to a financial institution, third-party processor or other member to identify the member in the transaction.

Incremental Authorisation

A request for an additional amount on a prior authorisation. An incremental authorisation is used when the final amount for a transaction is greater than the amount of the original authorisation. For example, a hotel guest might register for one night, but then decide to extend the reservation for additional night. In that case, an incremental authorisation might be performed in order to get approval for additional charges pertaining to the second night.

Issuer

The card issuer, typically a financial organisation authorised to issue cards. The issuer has a direct relationship with the relevant card scheme.

M

Mastercard clearing cycle

Mastercard provides 6-8 clearing updates during each day, with details of financial transactions that are due for settlement.

Merchant

The shop or store providing a product or service that the cardholder is purchasing. A merchant must have a merchant account, provided by their acquirer, in order to trade. Physical stores use a terminal or card reader to request authorisation for transactions. Online sites provide an online shopping basket and use a payment service provider to process their payments.

Merchant Category Code (MCC)

A unique identifier of the merchant, to identify the type of account provided to them by their acquirer.

MIP

Mastercard Interface Processor (MIP) The processing hardware and software system that interfaces with Mastercard's Global Payment System communications network.

O

Offline Transaction

This is often used in scenarios where the merchant terminal is not required to request authorisation from the card issuer (for example for certain low risk, small value transactions used by airlines and transport networks). The card CHIP EMV determines if the offline transaction is permitted; if not supported, the terminal declines the transaction. Note: Since the balance on the card balance is not authorised in real-time, there is a risk that the card may not have the amount required to cover the transaction.

P

Partial Amount Approval

Some acquirers support a partial amount approval for Debit or Prepaid payment authorisation requests. The issuer can respond with an approval amount less than the requested amount. The cardholder then needs to pay the remainder using another form of tender.

PGP

Pretty Good Privacy (PGP) is an encryption system used for both sending encrypted emails and encrypting sensitive files.

Program Manager

A GPS customer who manages a card program. The program manager can create branded cards, load funds and provide other card or banking services to their end customers.

R

reconciliation cycle

GPS receive six cycles of settlement data from Mastercard.

reconciliation date

The system processing date associated with the settlement of funds, as provided by Mastercard.

S

sFTP

Secure File Transfer Protocol. File Transfer Protocol (FTP) is a popular unencrypted method of transferring files between two remote systems. SFTP (SSH File Transfer Protocol, or Secure File Transfer Protocol) is a separate protocol packaged with SSH that works in a similar way but over a secure connection.

Smart Client

Smart Client is GPS's user interface for managing your account on the GPS Apex system. It is also called Smart Processor GPS. Smart Client is installed as a desktop application and requires a VPN connection to GPS systems in order to be able to access your account.

SSL Certification

An SSL certificate displays important information for verifying the owner of a website and encrypting web traffic with SSL/TLS, including the public key, the issuer of the certificate, and the associated subdomains.

T

TLS

Transport Layer Security (TLS) is a security protocol that provides privacy and data integrity for Internet communications. Implementing TLS is a standard practice for building secure web apps.
